Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary Examiner Dave Czekaj The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. If the period for reply specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 2. Claims 1-4 and 27 are rejected under 35 U.S.C. 102(e) as being anticipated by Peterson et al. (5986712), (hereinafter referred to as "Peterson").

Regarding claims 1-2 and 27, Peterson discloses an apparatus that controls the bit rate for partitions or stripes of video pictures (Peterson: column 1, lines 7-10). This apparatus comprises "maintaining a budget of a number of processing cycles that are available at a processor to process the data" (Peterson: figure 3, column 3, lines 40-42, wherein the budget is the target number of bits, the processing cycles is a function of the bits, i.e., the higher the number of bits, the more processing cycles that are required, the processor is the stripe encoder), "maintaining an estimate of the number of processing cycles required by the processor to process the video data" (Peterson: column 4, lines 1-7, wherein the estimate is the actual number), "providing the video data to the processor" (Peterson: figure 2, wherein the global rate controller supplies the video, the processor is the encoder), "wherein the processor operates in a

Application/Control Number: 09/665,372 Page 3

Art Unit: 2613

plurality of modes and selects one of the modes for processing each frame according to a relationship between the number of budgeted cycles and the estimated number of cycles" (Peterson: column 5, lines 24-67, column 6, lines 1-9, wherein the mode is the process of allocating extra bits to encoders that need them and taking extra bits away from encoders that don't need them. This is done by calculating differences between the target, or budgeted, and estimated, or actual, number of bits as illustrated in columns 5-10 for each frame where the frames are the I, P, and B frames).

Regarding claim 3, Peterson discloses "the estimated number of required cycles is updated after each frame is processed" (Peterson: figure 3, column 6, lines 23-32, wherein the estimated number is the actual number, which is computed after processing).

Regarding claim 4, Peterson discloses "the number of budgeted cycles is updated after each frame is processed" (Peterson: figure 3, item 301, wherein the budgeted cycles is the target, which is computed or updated for each new picture).

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

⁽a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Page 4

Application/Control Number: 09/665,372

Art Unit: 2613

4. Claims 5-10 and 14-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Peterson et al. (5986712), (hereinafter referred to as "Peterson") in view of Tabatabai et al. (5686964), (hereinafter referred to as "Tabatabai").

Regarding claims 5 and 14-17, Peterson differs from claims 5 and 14-17 in that claims 5 and 14-17 further require requantization, full transcoding, and bypass modes as claimed. Tabatabai teaches that selecting between modes is well known in the art as indicated by the prior art label of figure 3 (Tabatabai: figure 3, wherein the bypass mode is the top most switch position which bypasses motion compensation and requantization, the full transcoding mode is the bottom switch position which performs motion compensation, and the requantization mode is the middle switch position which performs requantization but no motion compensation. By selecting a mode for an I or P frame, all subsequent I and P frames would have the same mode applied to them as the original I or P frame). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to take the apparatus disclosed by Peterson and add the mode selection taught by Tabatabai in order to obtain an apparatus that more efficiently codes a frame by being able to select the mode desired.

Regarding claim 6, Peterson discloses "the number of budgeted cycles and the estimated number of cycles are provided for remaining frames of a GOP" (Peterson: column 11, lines 21-54, wherein the estimate is the actual, and the budgeted is the target or nominal).

Art Unit: 2613

Regarding claim 7, Peterson discloses "the estimated number of cycles associated with a current video frame is responsive to an actual number of cycles consumed for at least one previous frame" (Peterson: column 9, lines 10-24, wherein S_t is the actual number for the previous frame).

Regarding claim 8, Peterson discloses "storing the frames in a buffer associated with the respective processor prior to processing the frames" (Peterson: column 5, lines 36-37, wherein the buffer is the VBV buffer).

Although not disclosed, the buffer could comprise a "smoothing buffer" (Official Notice). Doing so would have been obvious since smoothing buffers provide a constant bit rate output.

Regarding claim 9, Peterson discloses "the processor is in a multiprocessor device" (Peterson: figure 2, wherein the processors are the encoders).

Regarding claim 10, Tabatabai discloses "the different modes have different computational intensities" (Tabatabai: figure 3, wherein the modes which utilize motion compensation would have a greater computational intensity than the modes which do not perform motion compensation).

5. Claims 11-12, 18, and 20-22 are rejected under 35 U.S.C. 103(a) as being unpatentable over Peterson et al. (5986712), (hereinafter referred to as "Peterson"), in view of Ozkan (5838686).

Regarding claim 11, as applied to claim 1, although Peterson does show a plurality of channels, these channels are different from the channels as claimed (Peterson: figure 2, wherein the channels are the paths connecting the GRC to

Art Unit: 2613

the encoders). Ozkan teaches that in order to maximize efficiency and utilization of a link, it is desirable to share the link among multiple video channels (Ozkan: column 1, lines 17-21). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to take the apparatus disclosed by Peterson and add the plurality of channels taught by Ozkan in order to obtain an apparatus that efficiently transfers data between two points.

Regarding claims 12 and 18, Peterson discloses "for each channel, determining if there is a cycle deficit associated with a current frame based on a carried over cycle deficit, if any, from a previous frame, and a difference between: an actual number of cycles used for the previous frame and the number of budgeted cycles for the current frame of the channel" (Peterson: column 5, lines 53-67 – column 6, lines 1-22, wherein the cycle deficit is indicated by the difference yielding a negative result).

Regarding claim 20, Peterson discloses "the processing cycle deficit is used in determining the estimated number of cycles" (Peterson: column 6, lines 1-16, wherein the estimated number is the actual number, the cycle deficit determines the bit allocation between the encoders which then yields the actual or estimated number of cycles used).

Regarding claim 21, Peterson discloses "the cycle deficit is associated with the remaining frames of a GOP of video" (Peterson: column 8, lines 22-67, wherein the association is calculating the number of remaining frames and then processing them using the cycle deficit).

Art Unit: 2613

Regarding claim 22, Peterson discloses "the selected mode for the current frame is based on whether cycle deficit exceeds a predetermined level" (Peterson: column 5, lines 24-67, column 6, lines 1-9, wherein the mode is the process of allocating extra bits to encoders that need them and taking extra bits away from encoders that don't need them. This is done by calculating differences between the target, or budgeted, and estimated, or actual, number of bits as illustrated in columns 5-10, wherein the predetermined level is 0. Once a deficit is detected, (greater or less than 0), bits are automatically allocated).

Allowable Subject Matter

6. Claims 13, 19, and 23-26 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure:
